EISEN, ALEXANDER

ART UNIT

PAPER NUMBER

2674

DATE MAILED: 12/10/2002

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary

Application No.

09/362,080

Applicant(s)

D'SOUZA ET AL.

Examiner

Alexander Eisen

Art Unit

2674

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 25 September 2002.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-19,30,31,33 and 34 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-19,30,31,33 and 34 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- 11) ☐ The proposed drawing correction filed on _____ is: a) ☐ approved b) ☐ disapproved by the Examiner.
- If approved, corrected drawings are required in reply to this Office action.
- 12) ☐ The oath or declaration is objected to by the Examiner.

Priority under 35 U.S.C. §§ 119 and 120

- 13) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.
- 14) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).
- a) ☐ The translation of the foreign language provisional application has been received.
- 15) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449) Paper No(s) _____.
- 4) ☐ Interview Summary (PTO-413) Paper No(s). _____.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: _____.

DETAILED ACTION

1. Claims 1-19, 30, 31, 33 and 34 are pending in current application, claims 1, 8, 12, 16, 30 and 33 are independent claims.
2. Claims 1-19, 30 and 33 have been entered as amended.

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 1-4, 6, 7, 16-19, and 33-34 are rejected under 35 U.S.C. 103(a) as being unpatentable over McManus in view of Narveson et al., ("Narveson"), US Patent No. 4,386,345 and further in view of Petitt et al., (hereinafter Petitt), US 6,108,053.

McManus discloses a system for computing polynomial equation coefficients to represent an input-output color characteristic of a color display device that can be used further for calculating the look-up tables converting the input signal to a color display into a color brightness displayed on the screen of the color display device.

McManus further teaches that the computer performing the task of calibration is supplied with the data, which is generated through the spectroradiographic analysis of the monitor during the manufacturing of the latter (col. 5, lines 48-67).

McManus does not specifically disclose that the polynomial coefficients are stored in a data storage device or memory in said color display device. McManus rather discloses that the

calculated coefficients are used for calculating look-up tables for each electron gun for consequently storing look-up tables by the computer.

Narveson teaches a color cathode ray tube having a "CRT personality PROM" containing the color/brightness characteristics of this particular CRT, input-output transfer characteristic included, which have been prepared during the CRT assembly (see abstract, col. 4, lines 3-38; col.4, line 57 – col.5, line 23).

Narveson also teaches storing polynomial coefficients for adjusting an electron beam focus in accordance with the reference brightness in the tube's personality PROM.

Neither McManus nor Narveson teach or suggest explicitly storing coefficient representation of color input-output characteristics, they rather teach the look-up tables, which are used for this purpose.

Petitt teaches a method for calibrating a color wheel system, wherein the derived correction coefficients are stored in the device memory of the wheel itself in order to associate these coefficients such that any color wheel could be used with any projector (column 8, line 30 – column 9, line 7).

It would be obvious to one of ordinary skill in the art at the time of the invention to use the teaching of Narveson in the display calibration system of McManus in the part that transfer characteristic data of a particular display is being stored in the memory of that display, which is integral part of the display, so that it would not require calibration each time of the using it in different computer system (Narveson, col. 4, lines 20-26), or to store coefficients rather than the look-up tables produced by these coefficients in the display device itself as taught by Petitt. Even though Petitt uses a simple linear correction coefficients (column 4), which are practically would

Art Unit: 2674

be equal to the first term of polynomial equations, it would have been obvious to one of ordinary skill in the art that the input-output characteristic could be presented by the polynomials of higher order, such as 5 or 7, for example, as taught by McManus.

As to claim 7, it is well known in the art that color correction is applicable to a color display of any type, be it VGA MultiSync CRT or LCD, or any other type, as long as it is used to display colors.

As to claim 19, it is obvious that data can be stored in any type of memory capable of storing digital data, DDC (dual-dielectric cells) memory devices included, and since it would not bring any unexpected results it would have been obvious to one of ordinary skills to use it.

5. Claims 8-13, 15 and 30-32 are rejected under 35 U.S.C. 103(a) as obvious over McManus in view of Petitt.

McManus discloses a system for computing polynomial equation coefficients to represent an input-output color characteristic of a color display device. McManus further teaches that the computer performing the task of calibration is supplied with the data, which is generated through the spectroradiographic analysis of the monitor during the manufacturing of the latter (col. 5, lines 48-67).

McManus does not specifically disclose that the polynomial coefficients are communicated to said color display device for storage in a data storage device associated with said color display device. McManus rather discloses that the calculated coefficients are used for calculating look-up tables for each electron gun for consequently storing look-up tables by the computer into a memory of the device driver (22) via the communication link (26).

Petitt teaches a method for calibrating a color wheel system, wherein the derived correction coefficients are stored in the device memory of the wheel itself in order to associate these coefficients such that any color wheel could be used with any projector.

It would have been obvious to one of ordinary skill in the art at the time of the invention to store coefficients produced by the calibration process of McManus in the memory of the display device itself as taught by Petitt, so that the display device could be used with any type of video source.

As to claim 10, it is well known in the art that color characteristics are changing with the temperature and most of the measurements in the world of testing are taken after the device under test is warmed up and its temperature is stabilized.

As to claim 11, it is obvious that data processed and stored in the computer system of McManus can be stored in any type of memory capable of storing digital data, DDC (dual-dielectric cells) memory devices included, and since it would not bring any unexpected results it would have been obvious to one of ordinary skills to use it.

6. Claim 5 is rejected under 35 U.S.C. 103(a) as being unpatentable over McManus in view of Narveson and further in view of Petitt and further in view of Minato et al., ("Minato"), US 4,379,292.

McManus discloses a system for computing polynomial equation coefficients to represent an input-output color characteristic of a color display device.

Narveson teaches a color cathode ray tube having a "CRT personality PROM" containing the color/brightness characteristics of this particular CRT, input-output transfer characteristic included, which have been prepared during the CRT assembly. Neither of the above disclose

Art Unit: 2674

expressly that a third order polynomial equation is used for representation, which predicts the brightness to within 0.3 foot-Lamberts for each input signal. McManus rather teaches that acceptable curve fitting results are obtained when the degree of the polynomial is in order from 5 to 7.

Petitt teaches a method for calibrating a color wheel system, wherein the derived correction coefficients are stored in the device memory of the wheel itself in order to associate these coefficients such that any color wheel could be used with any projector.

Minato teaches a luminance characteristic curves for a color display that can be presented by a polynomial equations of a third order (see FIG. 1 and equation (19) in column 5, line 10. It would have been obvious to one of ordinary skill in the art that color brightness characteristic for each input signal can be presented by a plurality of coefficients utilized in a third order polynomial equation, and that the order can be arbitrarily picked up by a designer depending on required accuracy, 0.3 fL included.

7. Claim 14 is rejected under 35 U.S.C. 103(a) as being unpatentable over McManus in view of Petitt and further in view of Minato.

McManus discloses a system for computing polynomial equation coefficients to represent an input-output color characteristic of a color display device.

McManus does not disclose expressly that a third order polynomial equation is used for representation, which predicts the brightness to within 0.3 foot-Lamberts for each input signal. McManus rather teaches that acceptable curve fitting results are obtained when the degree of the polynomial is in order from 5 to 7.

Petitt teaches a method for calibrating a color wheel system, wherein the derived correction coefficients are stored in the device memory of the wheel itself in order to associate these coefficients such that any color wheel could be used with any projector

Minato teaches a luminance characteristic curves for a color display that can be presented by a polynomial equations of a third order (see FIG. 1 and equation (19) in column 5, line 10. It would have been obvious to one of ordinary skill in the art that color brightness characteristic for each input signal can be presented by a plurality of coefficients utilized in a third order polynomial equation, and that the order can be arbitrarily picked up by a designer depending on required accuracy, 0.3 fL included.

Response to Arguments

8. Applicant's arguments have been fully considered but they are not persuasive.

9. In response to applicant's argument that there is no suggestion to combine the references, the examiner recognizes that obviousness can only be established by combining or modifying the teachings of the prior art to produce the claimed invention where there is some teaching, suggestion, or motivation to do so found either in the references themselves or in the knowledge generally available to one of ordinary skill in the art. See *In re Fine*, 837 F.2d 1071, 5 USPQ2d 1596 (Fed. Cir. 1988) and *In re Jones*, 958 F.2d 347, 21 USPQ2d 1941 (Fed. Cir. 1992). In this case, McManus teaches pre-calculated tables for the color correction, Narveson teaches where these tables is convenient to store (along with some other type of correction coefficients), and Petitt teaches the alternative way to store color correction information, namely coefficients themselves, rather than look-up tables based on the coefficients. All references represent same task and belong to the same art, so it would be only obvious to one of ordinary

Art Unit: 2674

skill in the art to look-up in all these references and make an educated decision of choices available while being challenged or confronted by this task.

10. In response to applicant's argument that the examiner's conclusion of obviousness is based upon improper hindsight reasoning, it must be recognized that any judgment on obviousness is in a sense necessarily a reconstruction based upon hindsight reasoning. But so long as it takes into account only knowledge which was within the level of ordinary skill at the time the claimed invention was made, and does not include knowledge gleaned only from the applicant's disclosure, such a reconstruction is proper. See *In re McLaughlin*, 443 F.2d 1392, 170 USPQ 209 (CCPA 1971).

11. The rejections are maintained.

Conclusion

12. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.
